

PX ONE

 perfect®

Purpose of use and effect-efficacy

This is the dental instrument with a one file glide path solution. Made with NiTi Alloy and uniquely shaped with a variable taper.

Instructions for use

According to its intended use, choose the most appropriate Perfect PX One and use it for glide path root canal.

Precautions for use

- 1) Prepare straight line access to canal orifice.
- 2) Explore the canal up to a 010 K-file.
- 3) Establish working length with an apex locator, alone or in combination with a radiograph. Confirm patency with a 010 K-file and verify a smooth, reproducible glide path.
- 4) Irrigate.
- 5) Use PX One in one or more passes until the full working length is reached.
- 6) Irrigate the expanded glide path.
- 7) Reconfirm the working length with a 010 K-file before shaping the canal with a rotary or reciprocating file (such as MTF PLUS GOLD Rotary File).
